Objective

Product-minded backend engineer who uses practical AI tooling to improve development efficiency while delivering maintainable customer-facing features, third-party integrations, and reliable backend services. Proven track record of turning product goals into measurable engineering outcomes, including CI/CD optimization, unit-test-driven delivery, zero-downtime upgrades, and production reliability improvements. Seeking a backend engineer role in a mission-driven product team to build scalable APIs and data systems, uphold code quality, and improve development efficiency through practical AI tooling.

Experience

OakMega

Backend Engineer

2025-02 - Present

Taipei, Taiwan

- Facebook and Instagram Comment Reply Bot:
 - Led end-to-end delivery from feasibility research and POC (month 1) to implementation (month 9) and post-launch maintenance, iteratively validating support scope across text, images, Reels, and post types.
 - Proactively drove Meta app review readiness by securing access, analyzing prior submissions, and documenting a reusable internal playbook for future permission applications.
 - Applied Cursor with project rules and skills to implement agreed API specifications, reducing development time by **50%** while keeping output aligned with existing code style.
- Audience Segmentation Link for LINE OA:
 - Built a new-versus-returning friend segmentation flow for campaign attribution and differentiated messaging in member growth scenarios.
 - Resolved webhook ordering race conditions between LINE Login redirects and friend-add events with delayed re-check logic, improving tagging accuracy with a known ~5-second delay in edge cases, and updated related frontend HTML for the operation flow.
- Customer Service Center Upgrade:
 - Expanded Meta messaging support in the customer service center to handle richer message types, serving 60 clients with 60,000 Facebook/Instagram connections.
 - Led capability mapping for story mentions and replies, enabling agents to identify context and open original story links directly in the CRM interface.
- Batch Messaging in Customer Service Center:
 - Implemented direct batch messaging in response to customer requests, eliminating post-based workarounds.
 - Set a 200-recipient per batch limit after traffic and latency evaluation to control system load.

PIMQ

Software Engineer

2021-02 - 2024-06

Taipei, Taiwan

- CI/CD Optimization:
 - Reduced test coverage execution time by **25%** through the implementation of a report cache.
 - Saved 80% of CI/CD cost** by using on-demand runners.
 - Achieved an **80% reduction** in test site deployment time by leveraging AWS launch templates.
- Engineering Quality and Delivery Workflow:
 - Performed peer code reviews focused on readability, maintainability, business-logic clarity, and feature interaction correctness.
 - Defined unit test goals and test cases before implementation, then added edge-case tests during development to improve release confidence.
 - Introduced a development environment setup runbook, resulting in **50% faster onboarding setup** and more consistent developer workflows.

- Reliability and Platform Upgrades:
 - Collaborated with colleagues to successfully **upgrade Kubernetes from 1.17 to 1.27** in EKS.
 - **Led** the upgrade of the company's MySQL from version **5.7 to 8 without downtime**.
- Product Features:
 - Delivered **more than 10** feature implementations.
 - **Independently** developed over **5 features**, including an energy management system and an electricity consumption and billing management system.

Technical Strengths

Programming Languages:	Python, Javascript, Shell scripts
Database Technologies:	MySQL, Redis, DynamoDB
Cloud Platforms:	GCP, AWS (EC2, DynamoDB, EKS)
Containerization:	Docker, Kubernetes
IaC Tools:	AWS CDK, Terraform
CI/CD Tools:	GitHub Actions

Education

National Taiwan University, Taipei
B.A. in Philosophy

June 2015
